

summarize this budget plan in a table

Time / Trigger	Qoder Mode	Recommended Model	Credit Rate	Use It For	Guardrails
Now to 22:00 Singapore time	Agent	Qwen3.7-Plus	0.1x	Read-only reviews, small fixes, docs, handoff notes, one-file edits, checking agent output	Avoid Expert mode and parallel teams unless a critical blocker appears.
22:00–08:00 Singapore time	Expert	Qwen3.7-Max	0.1x	Main coordinated build: scaffold React/Vite UI, install the six approved packages, wire local synthetic flows, type-check, build, and localhost walkthrough	Use one implementation owner, not several parallel experts plus QA.
22:00–08:00, only if blocked	Agent or Expert	Qwen3.8-Max	0.25x	Difficult cross-file TypeScript, React integration, or debugging that Qwen3.7-Max cannot resolve	Escalation only; it costs 2.5x more than Qwen3.7-Max off-peak.
After UI is working	Agent	Qwen3.7-Plus	0.1x now; 0.04x off-peak	Focused UI polish, responsive fixes, empty/error states, README, test cleanup	Keep tasks narrow and sequential.
Real service test rounds	Agent	Qwen3.7-Plus or Qwen3.7-Max if needed	Low-cost preference	One authorized Gemini/Nosana/Atlas case at a time; evidence capture and bug fixes	No parallel service calls; each call needs explicit approval.
Final submission phase	Agent	Qwen3.7-Plus	Lowest available rate	Demo script, README, slides, video checklist, submission QA	Preserve a credit buffer for last-minute fixes.
Credit allocation	Suggested reserve				
---	---				
React/Vite expert build tonight	250–350 credits				
Focused UI wiring and polish	150–200 credits				

Time / Trigger	Qoder Mode	Recommended Model	Credit Rate	Use It For	Guardrails
Authorized service-test debugging	250-350 credits				
Final submission materials and emergency fixes	400 credits minimum				
Avoidable spend	Broad parallel expert teams, duplicate agents, repeated audits without a clear failure				

Default rule: use Qwen3.7-Plus in Agent mode now, then switch to Qwen3.7-Max in Expert mode at 22:00 for the single major UI build.
