

while i am awake then we can code with qwen3.7-plus. when i go to bed then i switch qoder to expert mode with qwen3.8-max for difficulty and time-consuming. what do you think?

That is a sensible division, with one correction: **confirm which model Expert mode actually offers before you leave it unattended.** Your screenshot showed Qwen3.7-Max and Qwen3.7-Plus in Agent mode; availability can differ by Qoder mode. ^[1]

When	Qoder mode	Model	Best work
While awake	Agent	Qwen3.7-Plus	Build incrementally, inspect outputs, approve installs, fix type/build errors, and run the browser walkthrough.
Before bed	Expert/Quest, if available	Qwen3.8-Max	A clearly bounded, harder follow-up: broad UI polish, responsive/accessibility audit, test repair, or documentation/demo preparation.
If Qwen3.8-Max is not available in Expert	Agent	Qwen3.7-Max or Qwen3.7-Plus	Do not force Expert mode; use a single bounded Agent task instead.

The key is **do not queue the first implementation while asleep.** Start the UI build now with Qwen3.7-Plus because it has package installation, local checks, and possible setup decisions. Once the UI builds and you have reviewed its report, a bedtime Expert task can safely be limited to offline refinement—never credentials, service calls, or autonomous scope expansion. ^[2]

A good bedtime task boundary is: “Audit and improve only the local UI; do not add packages, access `.env.local`, call services, or change evidence.” What result from the awake build would tell you the project is stable enough to hand an overnight task to Expert mode?
